When it comes to California wildfires, it now takes days, not decades, to produce what had been seen as a once-in-a-lifetime occurrence.

Last weekend, a fire burning in California@s Sierra National Forest exploded in size, trapping hundreds of Labor Day holiday campers who could only be rescued by helicopters that made a series of white-knuckle flights into the smoke. Fire officials said they d never seen a fire move so fast in forestland 15 miles in a day.

Son Wednesday, a wildfire in Plumas National Forest northeast of San Francisco spread 25 miles in a day and devoured an estimated 400 square miles (1, 036 square kilometers),
br/>

In between those events, a massive fire in Monterey County doubled in size overnight. trapping 14 firefighters who had to deploy their emergency shelters; one was critically injured.

 They are only the latest examples of what a half-dozen fire experts agreed is more extreme fire behavior driven by drought and warming temperatures they attribute to climate change. Among the most concerning developments is that fast-moving wildfires leave less time for warnings or evacuations.

 Recently we have seen multiple fires expand by tens of thousands of acres in a matter of hours, and 30 years or more ago that just wasn t fire behavior that we saw, & said Jacob Bendix, a professor of geography and the environment at Syracuse University who studies wildfires.
